

BIODIVERSITY:

The variety of life found on Earth.
It is a measure of the variety of organisms
found in an ecosystem, that takes into account
factors like genetic and cultural diversity.

Coral reefs are the
hustling and bustling
cities of the sea.

Inside each of these buildings are thousands of people...just as the outside of a coral can be home to thousands of animals.

And, just like in a city of people, there are different jobs in the reef: scavengers, predators, filter feeders.
